AMENDMENTS TO THE CLAIMS

1. (Canceled)

2. (Currently amended) The signal processing system of Claim 1 Claim 19, wherein

the signal processing system is operable from a low voltage power supply providing a voltage

equal to or less than 1.5 volts.

3-4. (Canceled)

5. (Currently amended) The signal processing system of Claim 2, wherein the low

voltage power supply comprises at least one of a solar cell, a 1.5 volt coin type battery, and a

1.5 volt button type battery.

6-8. (Canceled)

9. (Currently amended) The signal processing system of Claim 8 Claim 19, wherein

the at least one digital differential value determining circuit comprises at least one clock circuit is

fabricated entirely on [[the]] a single silicon substrate in [[the]] an integrated circuit; the clock

circuit configured such that for at least one comparator included in the clock circuit a trip-point

voltage of the comparator and a voltage change rate of a clock ramp signal input to the

comparator are both controlled based on a common signal, such that variations in a voltage

supplied to the clock during normal operation does not substantially affect the clock period.

10. (Currently amended) The signal processing system of Claim 9 Claim 19,

wherein:

the clock circuit further comprises at least one resistor having a resistance that is a

primary determinant of the common signal, and at least one capacitor having a capacitance that is

a primary determinant the voltage change rate of the clock ramp signal;

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPILLE 1420 Fifth Avenue

Suite 2800

Seattle, Washington 98101 206.682,8100

-2-

the reference signal generator comprises at least one resistor having a resistance that is a

first primary determinant of the generated ADC ramp signal, and at least one capacitor having a

capacitance that is a second primary determinant of the generated ADC ramp signal; and

wherein a scale factor of the signal processing circuit is affected mainly by the resistance

that is a primary determinant of the common signal, the capacitance that is a primary determinant

of the voltage change rate of the clock ramp signal, the resistance that is a first primary

determinant of the generated ADC ramp signal, the capacitance that is a second primary

determinant of the generated ADC ramp signal, and the value of a voltage supplied to the

reference signal generator during normal operation.

11. (Previously presented) The signal processing system of Claim 10, further

comprising a power supply usable to provide a first voltage level to the reference signal

generator during normal operation and further usable to provide a second voltage level

proportional to the first voltage level to a transducer which determines at least one pair of

differential signals received by the signal processing system during normal operation;

wherein the scale factor of the signal processing circuit and the signal amplitude of the

differential signals determined by the transducer change in a manner that compensates each other

with regard to variations in the voltage of the power supply, such that the overall measurement

accuracy of a measuring instrument including the signal processing system and the transducer is

substantially insensitive to variations in the voltage of the power supply during normal operation.

12. (Previously presented) The signal processing system of Claim 11, wherein the

scale factor of the signal processing circuit is inversely proportional to the first voltage level and

the signal amplitude of the differential signals determined by the transducer are proportional to

the second voltage level.

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESS^{PLLC} 1420 Fifth Avenue

-3-

13. (Currently amended) The signal processing system of Claim 9 Claim 19, wherein:

the at least one digital differential value determining circuit further comprises at least one counter circuit corresponding to each at least one differential channel for counting repetitive clock cycles of the at least one clock circuit;

the digital differential value determining circuit starts a count of repetitive clock cycles based on the first-comparator output signal of a differential channel; and

the digital differential value determining circuit ends the count of the repetitive clock cycles based on the second-comparator output signal of the differential channel,

the digital value representative of the difference between the pair of differential signals received by that differential channel is based on the count of repetitive clock cycles; and

the at least one clock circuit is controllable to start operation that provides the repetitive clock cycles at the start of periods during which the at least one digital differential value determining circuit determines the digital value representative of the difference between the pair of differential signals and to stop operation at the end of such periods.

14-15. (Canceled)

16. (Currently amended) A signal processing system suitable for processing transducer signals in a low power measuring instrument, the signal processing system comprising;

a reference signal generator for generating an ADC ramp signal;

two or more differential signal channels, each differential signal channel comprising:

a first comparator comprising a first input, a second input, and an output, the first input of the first comparator receiving the first signal of a pair of differential signals, the second

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLEC 1420 Fifth Avenue Suite 2800 Seattle, Washington 98101 206.682.8100 input of the first comparator receiving the ramp signal, the output of the first comparator

providing a first-comparator output signal based on the signals at the first and second inputs;

a second comparator comprising a first input, a second input, and an output, the

first input of the second comparator receiving the second signal of the pair of differential signals,

the second input of the second comparator receiving the ramp signal, the output of the second

comparator providing a second-comparator output signal based on the signals at the first and

second inputs;

one or more digital differential value determining circuits for receiving the first-

comparator output signal and the second-comparator output signal of at least one of the

differential signal channels and determining a digital value representative of the difference

between the pair of differential signals received by the at least one differential signal channel;

wherein the signal processing system is operable from a low voltage power supply

providing a voltage less than 1.75 volts to process the signals of the at least two differential

signal channels in parallel and determine the corresponding digital values in parallel;

wherein at least one pair of differential signals depend on the operation of a transducer

included in a low power measuring instrument which also includes the signal processing system,

the low power measuring instrument operable to determine a measurement based on the digital

values; and

The signal-processing system of Claim 15, wherein the at least two differential signal

channels comprise at least three differential signal channels, the transducer comprises a

three-phase displacement transducer, and the at least one digital differential value determining

circuit determining at least three digital values representative of the differences between at least

three pairs of differential signals received by the at least three differential signal channels, the at

least three digital values further processable to determine a displacement measurement which is

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPULC 1420 Fifth Avenue **Suite 2800**

Seattle, Washington 98101 206.682.8100

-5-

substantially free of at least one of third harmonic spatial distortion and third harmonic signal processing distortion.

17. (Original) The signal processing system of Claim 16, wherein the transducer is an

inductive displacement transducer of a type such as linear, angular, or rotary.

18. (Original) The signal processing system of Claim 17, wherein the low power

measuring instrument is a handheld portable measuring instrument.

19. (Original) A signal processing system suitable for processing transducer signals

in a low power measuring instrument, the signal processing system comprising;

a reference signal generator for generating an ADC ramp signal;

one or more differential signal channels, each differential signal channel comprising:

a first comparator comprising a first input, a second input, and an output, the first

input of the first comparator receiving the first signal of a pair of differential signals, the second

input of the first comparator receiving the ramp signal, the output of the first comparator

providing a first-comparator output signal based on the signals at the first and second inputs; and

a second comparator comprising a first input, a second input, and an output, the

first input of the second comparator receiving the second signal of the pair of differential signals,

the second input of the second comparator receiving the ramp signal, the output of the second

comparator providing a second-comparator output signal based on the signals at the first and

second inputs; and

one or more digital differential value determining circuits for receiving the first-

comparator output signal and the second-comparator output signal of at least one differential

signal channel and determining a digital value representative of the difference between the pair

of differential signals received by the at least one differential signal channel; and

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLIC 1420 Fifth Avenue Suite 2800

Seattle, Washington 98101 206.682.8100 wherein the one or more digital differential value determining circuits comprise at least one clock circuit configured such that for at least one comparator included in the clock circuit a trip-point voltage of the comparator and a voltage change rate of a clock ramp signal input to the comparator are both controlled based on a common signal, such that variations in a voltage supplied to the clock during normal operation does not substantially affect the clock period.

20. (Canceled)

21. (Currently amended) The signal processing method of Claim 20 Claim 36,

wherein the generating, receiving, outputting and determining steps are performed using voltage

signals which do not exceed 1.5 volts.

22. (Currently amended) The signal processing method of Claim 20 Claim 36,

wherein the signal processing method further comprises repeating the generating, receiving,

outputting and determining steps as part of the operation of a measuring instrument which is

operated from a portable low power low voltage power supply and the generating, receiving,

outputting and determining steps are performed using voltage signals which do not exceed the

voltage provided by the portable low power low voltage power supply.

23-25. (Canceled)

26. (Original) The signal processing method of Claim 22, wherein the portable low

power low voltage power supply supplies a total average current of 10 microamps or less to the

portable measuring instrument during normal operation.

27. (Canceled)

28. (Currently amended) The signal processing method of Claim 27 Claim 36,

further comprising:

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESS^{PLLC} 1420 Fifth Avenue

Suite 2800 Seattle, Washington 98101

206.682.8100

-7-

providing a first voltage used to generate the ADC ramp signal;

providing a second voltage proportional to the first voltage to a transducer which

determines at least one pair of differential signals received by a corresponding differential signal

channel;

wherein a scale factor associated with the signal processing method and the signal

amplitude of the differential signals determined by the transducer change in a manner that

compensates each other with regard to proportional variations in the first and second voltages,

such that for a measuring instrument including the transducer and which also includes the signal

processing method as part of the operation of the measuring instrument the overall measurement

accuracy of the measuring instrument is substantially insensitive to normal variations in a power

supply used to provide the first and second voltages.

29. (Canceled)

30. (Currently amended) The signal processing method of Claim 20 Claim 36, the

method further comprising generating repetitive clock cycles, and wherein the step of

determining a digital value representative of the difference between each pair of differential

signals received by a differential signal channel comprises:

starting a clock that provides repetitive clock cycles at the start of periods during which a

digital value representative of the difference between a pair of differential signals received by a

differential signal channel is being determined;

starting a count of the repetitive clock cycles based on the first-comparator output signal

of a differential channel;

ending the count of the repetitive clock cycles based on the second-comparator output

signal of the differential channel;

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPILE 1420 Fifth Avenue

Suite 2800

Seattle, Washington 98101 206.682.8100

-8-

stopping the clock that provides repetitive clock cycles after ending the count of the

repetitive clock cycles; and

determining the digital value representative of the difference between the pair of

differential signals received by the differential channel based on the count of repetitive clock

cycles.

31-32. (Canceled)

33. (Currently amended) The signal processing method of Claim 32 Claim 36,

wherein at least one pair of received differential signals depend on the operation of a transducer

included in a low power measuring instrument which also includes the signal processing method

as part of the operation of the measuring instrument, the low power measuring instrument

operable to determine a measurement based on the digital values; and

the at least two differential signal channels comprising at least three differential signal

channels and the transducer comprising a three-phase displacement transducer, wherein the step

of determining a digital value representative of the difference between each pair of differential

signals received by a differential signal channel comprises determining at least three digital

values representative of the differences between at least three pairs of differential signals

received by the at least three differential signal channels, the at least three digital values further

processable to determine a displacement measurement which is substantially free of at least one

of third harmonic spatial distortion and third harmonic signal processing distortion.

34. (Original) The signal processing method of Claim 33, wherein the transducer is

an inductive displacement transducer of a type such as linear, angular, or rotary.

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLLC 1420 Fifth Avenue

Suite 2800

Seattle, Washington 98101 206.682.8100

35. (Original) The signal processing method of Claim 34, wherein the low power

measuring instrument is one of a portable measuring instrument and a handheld portable

measuring instrument.

36. (Original) A signal processing method suitable for processing transducer signals

in a low power measuring instrument, the signal processing method comprising;

generating an ADC ramp signal;

for at least one differential signal channel;

receiving the first signal of a pair of differential signals at a first input of a first

comparator of the differential signal channel and receiving the ramp signal at a second input of

the first comparator of the differential signal channel;

outputting a first-comparator output signal based on the signals at the first and

second inputs; and

receiving the second signal of a pair of differential signals at a first input of a

second comparator of the differential signal channel and receiving the ramp signal at a second

input of the second comparator of the differential signal channel;

outputting a second-comparator output signal based on the signals at the first and

second inputs;

generating at least one clock signal based on the operation of at least one comparator

wherein a trip-point voltage of the comparator and a voltage change rate of a clock ramp signal

input to the comparator are both controlled based on a common signal such that normal

variations in a voltage supply used to generate the clock signal do not substantially affect the

clock period and wherein the clock signal is used in the step of determining a digital value; and

determining a digital value representative of the difference between each pair of

differential signals received by a differential signal channel based on the first-comparator output

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLIC 1420 Fifth Avenue

1420 Fifth Avenue Suite 2800

Seattle, Washington 98101 206.682.8100

-10-

signal and the second-comparator output signal of that differential signal channel and the

generated at least one clock signal.

37. (Previously presented) A signal processing system suitable for processing

transducer signals in a low power measuring instrument, the signal processing system

comprising;

a reference signal generator for generating an ADC ramp signal;

two or more differential signal channels, each differential signal channel comprising:

a first comparator comprising a first input, a second input, and an output, the first

input of the first comparator receiving the first signal of a pair of differential signals, the second

input of the first comparator receiving the ramp signal, the output of the first comparator

providing a first-comparator output signal based on the signals at the first and second inputs; and

a second comparator comprising a first input, a second input, and an output, the

first input of the second comparator receiving the second signal of the pair of differential signals,

the second input of the second comparator receiving the ramp signal, the output of the second

comparator providing a second-comparator output signal based on the signals at the first and

second inputs;

a power supply usable to provide a first voltage level to the reference signal generator

during normal operation and further usable to provide a second voltage level proportional to the

first voltage level to a transducer which determines at least one pair of differential signals

received by the signal processing system during normal operation; and

one or more digital differential value determining circuits for receiving the first-

comparator output signal and the second-comparator output signal of at least one of the

differential signal channels and determining a digital value representative of the difference

between the pair of differential signals received by the at least one differential signal channel,

wherein:

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLIC 1420 Fifth Avenue

Suite 2800

Seattle, Washington 98101 206.682.8100

-11-

the signal processing system is operable to process the signals of the at least two

differential signal channels in parallel and determine the corresponding digital values in parallel;

and

a scale factor of the signal processing circuit and the signal amplitude of the differential

signals determined by the transducer change in a manner that compensates each other with

regard to variations in the voltage of the power supply, such that the overall measurement

accuracy of a measuring instrument including the signal processing system and the transducer is

substantially insensitive to variations in the voltage of the power supply during normal operation.

38. (Previously presented) The signal processing system of Claim 37, wherein the

scale factor of the signal processing circuit is inversely proportional to the first voltage level and

the signal amplitude of the differential signals determined by the transducer are proportional to

the second voltage level.

39. (Previously presented) The signal processing system of Claim 37, wherein the at

least one digital differential value determining circuit comprises at least one clock circuit; the

clock circuit configured such that for at least one comparator included in the clock circuit a trip-

point voltage of the comparator and a voltage change rate of a clock ramp signal input to the

comparator are both controlled based on a common signal, such that variations in a voltage

supplied to the clock during normal operation does not substantially affect the clock period.

40. (Previously presented) The signal processing system of Claim 39, wherein:

the clock circuit further comprises at least one resistor having a resistance that is a

primary determinant of the common signal, and at least one capacitor having a capacitance that is

a primary determinant of the voltage change rate of the clock ramp signal;

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESSPLLC 1420 Fifth Avenue Suite 2800

Suite 2800 Seattle, Washington 98101 206.682.8100

-12-

the reference signal generator comprises at least one resistor having a resistance that is a

first primary determinant of the generated ADC ramp signal, and at least one capacitor having a

capacitance that is a second primary determinant of the generated ADC ramp signal; and

wherein the scale factor of the signal processing circuit is affected mainly by the

resistance that is a primary determinant of the common signal, the capacitance that is a primary

determinant of the voltage change rate of the clock ramp signal, the resistance that is a first

primary determinant of the generated ADC ramp signal, the capacitance that is a second primary

determinant of the generated ADC ramp signal, and the value of a voltage supplied to the

reference signal generator during normal operation.

41. (Previously presented) The signal processing system of Claim 37, wherein the

signal processing system is operable from a low voltage power supply providing a voltage equal

to or less than 1.75 volts.

42. (Previously presented) The signal processing system of Claim 41, wherein the

signal processing system is operable from a low voltage power supply providing a voltage equal

to or less than 1.5 volts.

43. (Previously presented) A signal processing method suitable for processing

transducer signals in a low power measuring instrument, the signal processing method

comprising;

providing a first voltage usable to generate an ADC ramp signal;

generating the ADC ramp signal based on the first voltage;

providing a second voltage proportional to the first voltage to a transducer which

determines at least two pairs of differential signals received by a corresponding differential

signal channel;

for each of at least two corresponding differential signal channels;

LAW OFFICES OF CHRISTENSEN O'CONNOR JOHNSON KINDNESS**LLC 1420 Fifth Avenue

1420 Fifth Avenue Suite 2800

Seattle, Washington 98101 206.682.8100

receiving the first signal of a pair of differential signals at a first input of a first

comparator of the differential signal channel and receiving the ramp signal at a second input of

the first comparator of the differential signal channel;

outputting a first-comparator output signal based on the signals at the first and.

second inputs of the first comparator; and

receiving the second signal of a pair of differential signals at a first input of a

second comparator of the differential signal channel and receiving the ramp signal at a second

input of the second comparator of the differential signal channel;

outputting a second-comparator output signal based on the signals at the first and

second inputs of the second comparator; and

determining a digital value representative of the difference between each pair of

differential signals received by a differential signal channel based on the first-comparator output

signal and the second-comparator output signal of that differential signal channel,

wherein:

the providing a first voltage, generating, providing a second voltage, receiving, outputting

and determining steps are performed to determine the digital values corresponding to each

differential channel in parallel, and

a scale factor associated with the signal processing method and the signal amplitude of

the differential signals determined by the transducer change in a manner that compensates each

other with regard to proportional variations in the first and second voltages, such that for a

measuring instrument including the transducer and which also includes the signal processing

method as part of the operation of the measuring instrument the overall measurement accuracy of

the measuring instrument is substantially insensitive to normal variations in a power supply used

-14-

to provide the first and second voltages.
